Target Encoder[®]

What Is It?

The Target Encoder is a secure, **USER FRIENDLY**, Web-based, coding tool that makes auto and manual encoding of adverse events and medications terms obtained from Case Report Forms (CRFs) to standardized MedDRA, and WHO Drug Dictionary (WHO-DD) terms faster and easier. Once CRF terms are inputted into the System, each CRF term is searched in the designated MedDRA or WHO-DD database. The system generates and maintains a user-defined dictionary (UDD) repository of manually coded terms.

Benefits and Features

- **Browser-based** – Uses a compatible Web browser such as Microsoft Internet Explorer.
- **Limit System Access** - Provides access to authorized users (“coder”, “administrator”).
- **21 CFR Part 11** - Compliant with federal mandate for electronic record systems.
- **MedDRA Versions** – Compatible with multiple versions of MedDRA dictionary (identified with version number on Encoder screens). Only an administrator can specify the MedDRA version.
- **MedDRA Dictionary** – Medical event terms and associated coding information dictionary published by MSSO.
- **WHO Drug Dictionary** – Medical product dictionary published by UMC.
- **User Defined Dictionary (UDD)** – Manually coded repository of CRF terms that is categorized by studies.
- **Coding** - Select a study from a predefined list of studies. Select the data source table where input data (CRF terms) reside. Match CRF terms with standardized MedDRA terms.
- **Input Files** – Accepts data from multiple input tables derived from multiple studies.
- **Output** – Generates a database table of manually coded terms and a source database table.
- **Reports** – Generates a list Coded Table and Glossary.
